
1. Title

0:10 — open cold. Do not read the title or the tagline off the slide.

Say: *“I want to tell you about a man in Haveri who opened an envelope.”* Then advance.

Nothing on this slide needs explaining. The tagline lands at the end, not here.

2. Haveri, 2025

0:45 — the hook. Tell it, do not summarise it.

Four beats, in this order: he sells vegetables; vegetables are exempt from GST; he took UPI because we asked him to; the department added up four years of credits and sent him a bill for **₹29 lakh**.

Pause on the number. Then the card: within weeks, shutters across Karnataka read “No UPI, cash only.” Merchants we had just onboarded, boycotting the rail.

Close on the bottom line — the notices were withdrawn for traders who could *show* what they sold. Most could not. That verb is the whole product.

Then the bridge: *“and tax is no longer the only authority asking.”* That sentence is doing the repositioning — Haveri is not a tax story here, it is the moment taking digital money became a liability. The sharper version of it is two slides away.

Do not say this is happening right now. It is 2025. The next slide is what makes it current, and a judge who knows the episode will respect the distinction.

3. And this is not a 2025 story

0:25 — fast. This slide exists to kill one objection.

Say: *“That was last year. This was published ten days ago.”*

Do not read the quote. Point at the two bolded phrases only — **differences in turnover** and **exemption claims** — and say those two categories are the entire content of what we build.

Land on the last line and move. It is the handoff into the police slide: this is the slower authority. The other one freezes first and asks afterwards. Do not linger here — tax is no longer the headline.

4. Every rupee is now evidence

0:40 — two authorities, one unanswerable question.

Left card first and give it the time. Fraud money layers within minutes, and the shop at the end of the chain, *the one that sold someone a watermelon*, gets frozen. It did nothing wrong, it is not named in the FIR, and it finds out when a payment declines. Use the watermelon.

Right card briskly: the department reconciles collections against filed returns and bills the difference. One sentence, then move.

Then the pivot: both demand the same artefact — what was each rupee, actually.

Say the grey line as written. We do *not* claim Paytm does nothing with this data — it tags plenty. The gap is the merchant's own answer, captured when it is still knowable. Claiming otherwise in this room gets corrected.

Slow down for the red line. This is the business case, not a footnote: a frozen merchant stops transacting that morning, a frightened one takes the QR down for good. Dead Soundbox, zero GMV, no lending origination.

5. Gross credits are not turnover

0:45 — the hinge of the pitch. Let the picture work.

Say: *“One shop, one year, ₹60.98 lakh of credits. The red bar is what the notice counts as turnover — all of it.”*

Then the bottom bar. **Stop talking for two seconds** and let them read it.

₹42.9L really is turnover, and we say so. ₹18.1L is not: her savings account, her husband, a chit payout, a double-tap on the Soundbox.

Get in front of the obvious objection. Personal money is not supposed to touch a business QR. Say so first, then say it arrives anyway — that is an observation about merchants, not a loophole we are selling. The rule does not stop it; it only means no one is keeping a record of it.

And close on the second use. This volume is also why she cannot find the one credit the police care about. Same bar, same problem, and the freeze slide pays it off.

If challenged on the numbers: seeded ground truth from our generator, not an estimate. Accuracy against it is slide 14.

6. The insight

0:40 — why this is one product, not two.

Say: *“Most teams would build the fraud tool or the tax tool. They are the same engine.”* Both are downstream reads of one ledger — two output formats, and the freeze pack is the one we lead with.

Then the wedge, and say it slowly because it is the defensible-moat answer: Khatabook and Vyapar keep books after the fact, ClearTax files after the fact. Neither sits on the rail at the moment money moves. **Paytm does.**

Landing line: classification is cheap and accurate at the instant of the transaction, and unrecoverable eighteen months later when the notice arrives.

7. The engine

0:45 — the mechanism. Do not read the tag list.

Gesture at the eight tags, say “eight labels, every incoming credit gets one,” and move to the right-hand card, which is the real content.

The line that matters: you cannot infer “my husband sent this” from a QR payment. So the agent proposes a tag *with its reason* and she confirms with one tap. This is not a fallback — a ledger she attested contemporaneously survives a hearing; an algorithm’s guess produced under duress a year later does not.

Then the budget: at most three questions a day, and we measured 189 across a year, median 1.3. Ask more than that and the product is dead.

If asked about cost: 98.6% are ordinary sales settled by rules. The model only sees the 1.4% that need judgement.

8. What the merchant sees

0:20 — a glance slide. Do not tour the UI.

One sentence: everything classified, how close she is to the threshold, and the packs, on one surface.

Then the WhatsApp point — the same agent, where she actually is — and advance.

If someone asks whether this is built: the chat and the tools are live; this screen is the product surface we are designing toward.

9. Built on Phinite

0:40 — for the technical judges.

Two agent graphs, not four loose agents: `hisaab-watch` runs autonomously on cron, `hisaab-merchant` is the conversation. The nightly pass writes a queue; the chat reads it when she opens it — deliberately not a graph-to-graph call, because a queue that outlives either run is what makes the handoff robust.

Spend your time on the right-hand card. The strongest line in it: the Evidence agent is read-only — *the agent that builds the defence cannot edit the evidence*. And only the Merchant agent can commit an attested tag.

Those are enforced as Phinite tool policies, not conventions, and a denied call shows up in the trace.

10. Four decisions

0:35 — the slide that separates you from a demo.

Lead with #1: all arithmetic is deterministic Python, not model output. Wrapping arithmetic in an LLM is the standard tell, and the trace would show it.

Then #3: refusing to guess is a feature. An `unclassified` credit costs one tap; a confident wrong tag inside an evidence pack is a catastrophe.

Skim #2 and #4 — one clause each. #4 is worth a beat if the room is technical: we generated ground truth, so accuracy is a number instead of a claim.

11. Demo — an ordinary Tuesday (beat 1)

0:45 — or hand over to the live demo here.

Thirty-nine credits came in over the weekend, the agent asks about **three**. Read the Kannada line if you can; otherwise read the gloss under it.

Do not hide from the right-hand card — lead with it. The mid-review point was that personal money is not allowed on a business QR. Correct, and we say so on the slide. The argument is that the rule does not stop it, it only means no one records it, and an unrecorded credit is what an authority later reads as income.

Second half of that card matters just as much. We are not claiming Paytm does nothing. It already reads channel, linked VPAs and payer history. What no system has is her own answer, captured while it is still knowable. That is the product, and it is a smaller, truer claim than the one we started with.

Before going on stage: confirm the attestation queue is whole — `pending_total` must be 3. A rehearsal that taps through this beat spends the queue, and Render needs a clear-cache redeploy to restore it.

12. Demo — the emergency (beat 4)

0:50 — this is now the lead case. Give it the most time of the three.

Set the stakes in one sentence: account frozen at half nine, supplier payment due, 339 payments came in that week, and she is not named in the FIR.

Why this one leads. She did nothing wrong and there is no rule she broke. She sold onions to a customer who turned out to be laundering. Every objection available against the tax case — she should not have taken personal money on that QR, she should have registered — has no purchase here at all.

The agent isolates ₹4,200 by UTR *and independently* by amount and date, and brings the POS bill with it — the items, till POS01, 19:47.

The decoy is the point. A second ₹4,200 that same week from a regular customer, listed in the pack and explicitly not chosen. Anyone can match an amount; the pack shows its work.

Finish on the red line: it never asserts she is innocent. Some frozen accounts genuinely are mule accounts. We assemble evidence; a human decides, and Escalation holds the pack for approval.

13. Demo — the warning and the notice (beats 2 and 3)

0:50 — two tax beats on one slide, deliberately compressed.

Left: replayed as of 31 January, the agent says she crosses ₹40 lakh around 14 March. **Say the red line out loud** — its first act on the tax side is telling her she owes a registration. That is what stops the room turning hostile.

Right: the notice claims ₹60.98 lakh, and the pack answers it line by line, every figure traceable to transaction IDs. Then the honest half: **the claim is wrong, and she did cross ₹40 lakh, and she must register.**

If a judge diffs this against slide 5: slide 5 shows seeded truth (₹42.9L), this shows what our system computed (₹42.2L). The 1.6% between them is the accuracy claim — say that, do not hedge.

If pushed on the personal and own-account lines: same answer as slide 11. Those credits should not be on a business QR, they are there anyway, and the alternative to classifying them is letting them be read as income.

14. What we can actually prove

0:30 — do not read all four. Pick two.

Lead with **1.6%** error on turnover and **1.3 questions a day**. The other two are there to be read, not narrated.

The credibility move is the box on the right — volunteer the weakness before anyone finds it. A rules-only baseline gets 99.3% on sale vs not-a-sale but catches only 77.8% of non-sale credits, and that residue alone puts two eval merchants on the wrong side of ₹40 lakh. Closing it is what the agent plus one tap is for.

Last line if you have the beat: she corrected the agent 52 times that year, and those corrections are the ledger's strongest evidence, not its failures.

15. The line we do not cross

0:30 — the non-negotiables, fast, then land.

Run the five bullets at pace. The one to hit is the first: we never assert innocence on a freeze. The last is the mid-review answer, on the slide on purpose.

Then the navy box: provenance is cheap only on the rail, and a frozen merchant stops transacting the same morning.

Final line, unhurried: *"Paytm Hisaab. Every rupee, on your side."* Stop talking.

— Q&A prep —

"Merchants may not take personal money on a business QR." Correct, and slide 11 says so before you have to. It arrives anyway, and the alternative to recording it is letting an authority read it as income. We are not defending the behaviour — we are refusing to let it become a liability.

"Paytm already tags transactions." It does, and we build on that rather than around it: channel, linked VPAs and payer history feed the rules layer. What no tag carries is her attestation — the part an authority accepts, and the only part she alone can give.

"No return mismatch?" That check needs a *registered* composition dealer who filed a CMP-08 to disagree with. Ours is unregistered, which is why she gets a notice at all; the eval split has one with four quarters seeded.

"Exempt vs taxable on a QR sale?" Not per payment. We apportion by value from that shop's own POS-billed ratio and label it an estimate. Labelling each sale by its majority side understated taxable turnover threefold.

"Four LLM calls in a trenchcoat?" Everything deterministic is a skill and four agents is the ceiling. If twenty lines of Python replaces an agent, it should have been a skill — the trace shows which is which.

"No standing with the police." Agreed: Paytm supplies, the merchant files. By design. Cash sales are real, out of scope, and on the slide.
